A report on

Water Facilities and Drinking Water Availability

In this event, all second year student and staff have participated. Principal Sir initiated and told the importance on "**Water Facilities and Drinking Water Availability**".

Respected Chairman, Sri Dadi Ratnakar Garu also stressed on the importance on "**Water Facilities and Drinking Water Availability**".

The awareness campaign was conducted in Munagapaka, Anakapalle by NSS team. In this event DIET NSS officer, Principal and Chairman Sir initiated for "**Water Facilities and Drinking Water Availability**". Second year students participated successfully in the event.

In 2020, 74% of the global population (5.8 billion people) used a safely managed drinking-water service – that is, one located on premises, available when needed, and free from contamination.

Globally, 2 billion people do not have safely managed drinking water services, 3.6 billion do not have safely managed sanitation service, and 2.3 billion do not have access to a handwashing facility with water and soap at home.

Figure: Awareness session on "Water Facilities and Drinking water Availability"

Public Satisfaction with Drinking Water Quality:

Survey responses regarding the degree of public satisfaction with drinking water quality. A total 20.5% of respondents were very satisfied with the quality of their drinking water, 59.8% were relatively satisfied, and 18.3% of them felt dissatisfied with their current drinking water quality. Correlation analysis between drinking water type and degree of public satisfaction revealed that people whose main drinking water source was barreled or bottled water had the highest degree of satisfaction with a proportion as high as 100%; this was followed by tap water and well-water sources, with satisfaction degree of 87.1% and 62.5%, respectively. Those with spring water as their main water source reported the lowest satisfaction levels of only 40.0%.

A safe and convenient water supply plays a vital role in public and well-being of society. Most water treatment plants in two pilot counties are very small, with mainly centralized (or sometimes decentralized) township and rural water supplies, and the water supply ability is less than 1000 m³/d. The water treatment equipment is relatively simple and crude, even, there is not water treatment equipment in these water utilities, and the purification capacity is thus very limited and some contaminants should not be removed at these treatment facilities. And many residents were eager to know whether their drinking water is clean or not, therefore, most of respondents paid high attention to the quality of drinking water. The residents think that the main related factors influencing drinking water quality include water source quality, water pipe network and water treatment technology, and with the ratios of 70.1%, 51.4% and 51.1%, respectively. And only 12.5% of residents regard usage of tap water as main influencing factors.
